

Extracts from a pamphlet published by Joseph Barnes, July 7, 1788, proving that James Rumsey was the original and successful inventor of steam-boat navigation against the pretensions of Fitch.

ANTIETAM IRON WORKS, MARYLAND,

May 15, 1787.

1786, January 26—James Rumsey had some iron bars drawn in the shape and about the size of gun-scalps. I find accordingly that he had

2 scalps, weight	-	-	-	lbs.	27½
February 1, 2 scalps, weight	-	-	-		84
February 4, 2 scalps, weight	-	-	-		67

178½

At the time Mr. Rumsey applied for the above, I understood he wanted it for some purposes of his machinery. Given under my hand the date above.

JOHN RITCHIE,

Who was manager at the works.

Mr. Morrow paid nine pounds sixteen shillings to Mr. Raborg, of Baltimore, for James Rumsey, for brass cocks, cast by said Raborg, 29th October, 1785. Certified by John Mark.

ABRAHAM SHEPHERD.

Mr. Charles Morrow deposes that Joseph Barnes was sent by Mr. Rumsey to Baltimore, to get some parts of the machinery cast for his steamboat early in the month of October, 1785, and, on his return, told this deponent that he had got four large cocks cast, but being disappointed in receiving money in Baltimore, he left them until paid for as above proved.

CATO MOORE.

Michael Enbler and Jonathan Osborn welded the pipes (Antietam iron) for Rumsey, in the beginning of February, 1786. The pipes were about the size of gun-barrels; that they were connected by screws, and were bent nearly in the shape of a still-worm; but the rounds placed so close as nearly to touch each other.

Sworn, May 16, 1788, before

JOHN KEARSLEY.

Conrad Byers made handles and springs to the brass cocks in October or November, 1785; and in the latter end of November made two pistons of about thirteen inches diameter, and sundry other things, which he understood were all parts of the machinery for Rumsey's steamboat. He was assisted by Philip Studer.
